

METHODS FOR DIAGNOSIS AND TREATMENT OF BLOOM'S SYNDROME

Abstract of the Disclosure

5 The present invention provides a method for
diagnosing BS as well as determining whether a subject is a
carrier of a mutated *BLM* gene. The present invention also
provides one or more single-stranded nucleic acid probes and
antibodies which may be formulated in kits, and used for
diagnosing BS or determining whether a subject is a carrier
of a mutated *BLM* gene. In addition, the present invention
10 provides a method for treating or preventing the onset of BS
in a subject in need of such treatment or prevention, as well
as vectors and stem cells useful for such treatment or
prevention. The present invention also provides a purified
and isolated nucleic acid encoding an enzymatically active
15 *BLM* protein, a vector comprising this nucleic acid, a cell
stably transformed with this vector, as well as a method for
producing recombinant, enzymatically active *BLM* protein. A
purified, enzymatically active *BLM* protein is also provided
by the present invention. Finally, the present invention
20 provides a vector, an embryonic stem cell, and a non-human,
transgenic animal, each of which comprises a mutated *BLM*
gene, as well as a method for producing the non-human,
transgenic animal.
